Food and Health: Science and Technology G. G. Birch,K. J.

Parker,2012-12-06 The Control and Standardisation of National Food Quality There must be very many different opinions as to what this title means To some people it will mean the control by legislation of additive and contaminant levels in food to others it may mean the laying down of compositional standards for different food commodities yet again some may consider that it covers the nutritional quality of the food and the maintenance of an adequate satisfactory diet for the population of the country I think certainly that it could be all of these things and a glance at the variety of titles of papers which other speakers will be giving later in this symposium illustrates the very wide area which is covered by food quality in its many aspects I will try only to present to you some of those aspects which are the concern of government in the control of food quality I will not concern myself with those aspects which are the concern only of the manufacturer and his customer and here I am thinking of flavour appearance and physical state such as whether canned fresh or frozen These aspects which affect the type of products to be marketed and also the aspects of quality control which set out to maintain the standard that the manufacturer has set himself are I think outside my province

Lucarini, 2022-04-08 **Dense Phase Carbon Dioxide** Murat O. Balaban, Giovanna Ferrentino, 2012-04-05 Dense phase carbon dioxide DPCD is a non thermal method for food and pharmaceutical processing that can ensure safe products with minimal nutrient loss and better preserved quality attributes Its application is quite different than for example supercritical extraction with CO₂ where the typical solubility of materials in CO₂ is in the order of 1% and therefore requires large volumes of CO₂ In contrast processing with DPCD requires much less CO₂ between 5 to 8% CO₂ by weight and the pressures used are at least one order of magnitude less than those typically used in ultra high pressure UHP processing There is no noticeable temperature increase due to pressurization and typical process temperatures are around 40 C DPCD temporarily reduces the pH of liquid foods and because oxygen is removed from the environment and because the temperature is not high during the short process time typically about five minutes in continuous systems nutrients antioxidant activity and vitamins are much better preserved than with thermal treatments In pharmaceutical applications DPCD facilitates the production of micronized powders of controlled particle size and distribution Although the capital and operating costs are higher than that of thermal treatments they are much lower than other non thermal technology operations This book is the first to bring together the significant amount of research into DPCD and highlight its effectiveness against microorganisms and enzymes as well as its potential in particle engineering It is directed at food and pharmaceutical industry scientists and technologists working with DPCD and other traditional or non thermal technologies that can potentially be used in conjunction with DPCD It will also be of interest to packaging specialists and regulatory agencies
