Genetic Variation And Dietary Response:

Genetic Variation and Dietary Response Artemis P. Simopoulos, P. J. Nestel, 1997-01-01 This timely volume focuses on genetics and nutrition and their interaction in the development of chronic diseases Knowledge of genetic susceptibility to disease will not only help to identify those at higher risk for disease but also to ascertain their response to diet The prospect of targeting specific dietary treatment at those predicted to gain the most therapeutic benefit clearly has important clinical and economic consequences particularly in diseases of high prevalence This book is unique in considering genetic variation in susceptibility to disease and the importance of specific diets in influencing lipid levels in cardiovascular disease and bone density in osteoporosis The contributions emphasize that dietary response is dependent on the genetic variant and that specific dietary recommendations rather than universal ones are needed for the prevention and management of chronic diseases Bringing together vital information for the first time this book is important reading for physicians nutritionists dietitians geneticists physiologists molecular biologists food technologists and policymakers Nutrigenetics and

Nutrigenomics Artemis P. Simopoulos, J. M. Ordovas, 2004-01-01 For the first time international scientists describe the advances in genetics and nutrition by combining methods of molecular biology with those of functional genetics also known as systems biology This book provides the latest data on genetic variation and dietary response nutrients and gene expression and the contribution molecular biology has given to systems biology It also includes a comprehensive critique of genetic association studies in defining the risk of chronic diseases and concludes that molecular diagnostic tests will eventually affect every area of health care from individual risk prediction early diagnosis of disease and determination of optimal treatment regimens to monitoring treatment effectiveness The appendix contains an extensive glossary of the newly emerging terminology as well as recommendations for genetic screening This publication is an essential tool for the future work of all physicians nutritionists dietitians geneticists physiologists molecular biologists anthropologists food technologists policy makers ethicists and educators **Evolutionary Aspects of Nutrition and Health** A. P. Simopoulos, Berthold

Koletzko, 1999-07 The issues treated in this publication are brought together in this way for the first time For many of the chronic diseases familial predispositions are well established and there is good evidence for true genetic predisposition When Homo erectus emerged 1.7 million years ago humans existed as non cereal eating hunter gatherers It is on this basis that according to the hypothesis of the carnivore connection an insulin resistant genotype evolved to provide survival and reproductive advantages to populations adapted to a high meat low plant food low carbohydrate nutritional environment Cereal became the major source of calories and protein in the human diet only about 10 000 years ago Humankind has thus had little evolutionary experience to adapt to this new food type maladaptation being the consequence Moreover studies comparing energy expenditure in Western societies and during the Paleolithic period indicate a low level of physical activity not previously encountered in human history a state to which humans are not genetically adapted Together with the dietary

changes this has led to a modern environment in which a number of individuals are prone to chronic diseases causing increases in non insulin dependent diabetes mellitus hypertension coronary artery disease cancer and obesity As a consequence the lifestyle approach for the prevention and management of these diseases is essential varying with national dietary patterns and national economy This publication will be of special interest to physicians geneticists nutritionists dieticians anthropologists food technologists food policy makers and individuals interested in personal and family health

Nutrition and Fitness: Diet, Genes, Physical Activity and Health A. P. Simopoulos, K. N. Pavlou, Berthold Koletzko, 2001-07 This is the first of two volumes containing the proceedings of the Fourth International Conference on Nutrition and Fitness It presents the latest data on the interrelationships of genes nutrients and physical activity as they influence the phenotype throughout development The human genome was shaped by the environment especially diet and physical activity The phenotype is thus the result of continuous gene environment interactions However new data indicate that the environment has changed enormously especially during the last 100 years so that it is no longer in harmony with the human genome A new discipline is evolving called Nutrigenetics which combines concepts and methods

from genetics and nutritional sciences and the term refers to individual variability in response to diet. The papers presented make it abundantly clear that we must make a conscious effort to develop in all dimensions the environment particularly diet and physical activity in which the human genome finds its optimal expression. This approach of individualized environmental modification is called Euphenics and it must evolve simultaneously with Genomics and the use of genotypic analyses to enhance the quality of medical care for the individual. The euphenic approach is essential for the prevention and management of chronic disease. These proceedings will be of interest to geneticists, nutritionists and dietitians, exercise physiologists, anthropologists, psychologists and psychiatrists, pediatricians, internists, general practitioners, health care providers, scientists in government and industry, policymakers and governmental organizations. **Nutrition and Fitness** Artemis P.

Simopoulos, 2005-01-01 Despite the enormous interest in discovering longevity genes in humans, the results have been elusive while the effects of physical activity in delaying aging are promising and the importance of caloric restriction is now being systematically investigated. At present, there is enough evidence to define the components of a healthy diet and physical activity lifestyle at the population level and it is clear that lack of exercise is associated with increased risk of premature chronic disease and death. Currently, research aims at defining the type and frequency of genetic variation and its influence.

A Balanced Omega-6/Omega-3 Fatty Acid Ratio, Cholesterol and Coronary Heart Disease A. P. Simopoulos, F. De Meester, 2009-08-12

For more than half a century the relationship between dietary factors and coronary heart disease CHD has been a major focus of health research Contrary to the established view current data suggest that dietary cholesterol is not a primary factor of or causes heart disease with the possible exception of the genetic forms of familial hypercholesterolemias For instance recent clinical trials evaluating the effect of cholesterol lowering drugs on the development of chronic heart failure diabetes and stroke have yielded disappointing results On the other hand an unbalanced omega 6 omega 3 fatty acid ratio and a cholesterol intake not consistent with the amount during evolution seem to be causal factors in the development of CHD A panel of international experts in genetics nutrition fatty acid cholesterol metabolism and coronary heart disease has contributed to this publication summarizing and critically discussing for the first time the importance of evolutionary aspects of diet the omega 6 omega 3 fatty acid ratio and cholesterol intake relative to health and CHD They also propose measuring blood fatty acids in the population in order to define the risk of CHD and other chronic diseases This book will be of interest to physicians cardiologists gerontologists and pediatricians nutritionists dieticians health care providers scientists in industry and

P. Simopoulos, L. G. Cleland, Berthold Koletzko, 2003-07 Studies on the evolutionary aspects of diet and molecular studies included in this volume indicate that human beings evolved on a diet that was balanced in the essential fatty acids EFA In fact the ratio of omega 6 omega 3 EFA was 1:1 whereas present day diets in both developed and developing countries have a much higher ratio between 5:1 and 50:1 Additional studies show that a high ratio of omega 6 omega 3 EFA is detrimental to health and may lead to the development of chronic diseases Improving the dietary ratio by decreasing the omega 6 fatty acids and increasing the omega 3 fatty acids is essential for brain function and for the management of cardiovascular disease arthritis and cancer A ratio of 4:1 or less leads to lower dosage and to the reduction of adverse effects of drugs This volume should be of interest to a large and varied audience of researchers in academia industry and government cardiologists geneticists immunologists neuroscientists and cancer specialists as well as nutritionists dietitians food scientists agriculturists economists and regulators
