Environmental and Lifestyle Influences on Breast

Cancer Risk Mary-Claire King,2000 Women with inherited mutations in BRCA1 or BRCA2 have significantly elevated risks of breast cancer However not all women with inherited BRCA1 or BRCA2 mutations develop breast or ovarian cancer and among those who do ages at cancer onset vary widely even within the same family If a woman with a BRCA1 or BRCA2 mutation remains free of breast cancer for many years it is possible that her status is due to chance to modifying genes segregating in some families or to environmental factors that influence risk In this project we evaluate environmental and lifestyle factors that could influence the impact of mutations in BRCA I and BRCA2 on disease risk It is possible that such co factors identified among genetically predisposed women may be generalized to women who have not inherited predisposition to breast or ovarian cancer because clinically and biologically inherited cancer is virtually indistinguishable from its far more common non inherited counterpart
