**Systems Biology and Antimicrobial Drug Resistance** Vijay Soni , Saurabh Mishra, Aditya Kumar Sharma, Neha Dubey, 2024-09-18 Antimicrobial resistance AMR poses a significant threat to global public health With the emergence of new resistant strains and limited antibiotic treatment options it has become increasingly difficult to treat infections effectively This is particularly concerning for bacterial infections like Mycobacterium tuberculosis Acinetobacter spp Staphylococcus aureus and Pseudomonas aeruginosa where only a limited number of antibiotics are available for treatment According to the US National Strategy for Combating Antibiotic Resistant Bacteria approximately 2 million Americans are infected with antibiotic resistant bacteria each year and at least 23 000 die as a result The situation is even worse in developing countries Systems biology which aims to understand the complex interactions between the different components of a biological system has emerged as a powerful tool for studying AMR By integrating data from multiple sources including genomics transcriptomics proteomics and metabolomics systems biology can provide a comprehensive view of the mechanisms underlying AMR This approach can lead to the identification of novel targets for drug development and the development of personalized treatment strategies that

consider the specific characteristics of individual patients and the pathogens that infect them This Research Topic aims to explore the potential of systems biology in combating antibiotic resistance and highlight the need for further research to fully realize its clinical potential in infectious diseases      **Research Awards Index** ,1986      **Research Grants Index** National

biomedicine and environmental sciences      **Iron-containing Enzymes** Sam P. De Visser, Devesh Kumar, 2011 There are many mononuclear iron containing enzymes in nature that utilize molecular oxygen and transfer one or both oxygen atoms of O<sub>2</sub> to substrates These enzymes catalyze many processes including the biosynthesis of hormones the metabolism of drugs DNA and RNA base repair and the biosynthesis of antibiotics Therefore mononuclear iron containing enzymes are important intermediates in bioprocesses and have great potential in the commercial biosynthesis of specific products since they often catalyze reactions regioselectively or stereospecifically Understanding their mechanism and function is important and will assist in searches for commercial exploitation In recent years advances in experimental as well as theoretical methodologies have made it possible to study the mechanism and function of these enzymes and much information on their properties has

been gained This book highlighting recent developments in the field is therefore a timely addition to the literature and will interest a broad readership in the fields of biochemistry inorganic chemistry and computational chemistry The Editors leaders in the field of nonheme and heme iron containing monooxygenases have filled the book with topical review chapters by leaders in the various sub disciplines **User-Friendly Tools Applied to Genetics or Systems Biology** Helder
