

Rocks Record Changes

Rocks tell a story of environmental change. Changes in our environment study the chemical composition and structure of rocks to understand the conditions in which they formed. Many rocks contain fossils of organisms that once lived on the rock surface. The structure, grain, and location of rock can reveal clues about glaciers, floods, seismic events, and tectonic movements. These rocks can even be dated.

Clues from this Rock Cycle

Geologists know that in millions of years, rocks can transform from one type to another. This process is called the rock cycle.

Geologists can learn about the environment in which a rock formed by studying its texture, grain, and location.

Clues from Index Fossils

Geologists use the fossils in rocks to determine the age of the rocks. Fossils are the remains of plants and animals that lived long ago. Some fossils are small, but they can be used to date the rocks. Fossils are also used to determine the environment in which the rocks were formed. Fossils can tell us about the climate, the sea level, and the type of organisms that lived in the area.
