Geochemistry Of Organic Molecules Benchmark Papers In Geology 52:

Geochemistry of Organic Molecules Keith A. Kvenvolden, 1980 50 Years of Ocean Discovery National Research Council, Division on Earth and Life Studies, Commission on Geosciences, Environment and Resources, Ocean Studies Board, 2000-01-03 This book describes the development of ocean sciences over the past 50 years highlighting the contributions of the National Science Foundation NSF to the field's progress. Many of the individuals who participated in the exciting discoveries in biological oceanography, chemical oceanography, physical oceanography and marine geology and geophysics describe in the book how the discoveries were made possible by combinations of insightful individuals, new technology and in some cases serendipity. In addition to describing the advance of ocean science, the book examines the institutional structures and technology that made the advances possible and presents visions of the field's future. This book is the first ever documentation of the history of NSF's Division of Ocean Sciences, how the structure of the division evolved to its present form and the individuals who have been responsible for ocean sciences at NSF as rotators and career staff over the past 50 years.

Thermal Modeling of Petroleum Generation Colin Barker, 1996 Petroleum exploration has always been limited by the lack of adequate subsurface control. Exploration problems are usually problems of extrapolation, i.e. to greater depth to laterally equivalent rocks or back through time. Models are widely used as a way of describing complex geological systems so that they can be treated quantitatively and used as the basis for extrapolations and predictions. Models consider typically a simplified geological system that can be described mathematically. It is very important to know what simplifying assumptions have been made when these assumptions are valid and under what conditions their use may not be appropriate. This requires an understanding of the concepts involved in building the model and how the model operates. Models are best used as a tool for probing the system and evaluating the sensitivity of the conclusions to possible uncertainties in the values of the input parameters. In a sense, models permit experimental petroleum geochemistry and allow the user to answer the 'What if' questions, e.g. 'What if the geothermal gradient had been higher in the past?' 'What if the organic matter type had been different?' This book provides students, exploration geologists and others who would like to use the available models with a general idea of how the models work, what they can do and what their limitations are. It also provides the information necessary to obtain the input data required by the commercial models. National Union Catalog, 1980, 1981 Water Pollution Research Journal of Canada, 1986
