Geodynamics of Lithosphere & Earth's Mantle Jaroslava Plomerova, Robert C. Liebermann, Vladislav Babuska, 2012-12-06 Plate tectonics has significantly broadened our view of the dynamics of continental evolution involving both the processes currently active at the surface and those extending deep into the interior of the Earth Seismic anisotropy provides some of the most diagnostic evidence for mapping past and present deformation of the entire crustmantle system This volume contains papers presented originally at an international workshop at the Chateau of Trest in the Czech Republic in 1996 This workshop brought together geophysicists and geologists who work in the field of observational and theoretical seismology mineral and rock physics gravity studies and geodynamic modelling Topics include large scale anisotropy of the Earth s mantle mantle heterogeneity vs anisotropy 3 D velocity and density structures and inferences on mantle dynamics mineral and rock physics studies and mathematical aspects of complex wave propagation **Geodynamics of Lithosphere and Earth's Mantle** Jaroslava Plomerova, R. Liebermann, Vladislav Babuška, 1998 The Earth's Crust and Upper Mantle Pembroke J. Hart, 1969 Geodynamics Donald Turcotte, Gerald Schubert, 2014-04-07 A fully updated third edition of this classic textbook containing two new chapters on numerical modelling supported by online MATLAB codes **Treatise on Geophysics**, 2015-04-17 Treatise on Geophysics Second Edition is a comprehensive and in depth study of the physics of the Earth beyond what any geophysics text has provided previously Thoroughly revised and updated it provides fundamental and state of the art discussion of all aspects of geophysics A highlight of the second edition is a new volume on Near Surface Geophysics that discusses the role of geophysics in the exploitation and conservation of natural resources and the assessment of degradation of natural systems by pollution Additional features include new material in the Planets and Moon Mantle Dynamics Core Dynamics Crustal and Lithosphere Dynamics Evolution of the Earth and Geodesy volumes New material is also presented on the uses of Earth gravity measurements This title is essential for professionals researchers professors and advanced undergraduate and graduate students in the fields of Geophysics and Earth system science Comprehensive and detailed coverage of all aspects of geophysics Fundamental and state of the art discussions of all research topics Integration of topics into a coherent whole Seismology and Structure of the Earth Barbara Romanowicz, Adam Dziewonski, 2010-04-20 Treatise on Geophysics Seismology and Structure of the Earth Volume 1 provides a comprehensive review of the state of knowledge on the Earths structure and earthquakes It addresses various aspects of structural seismology and its applications to other fields of Earth sciences The book is organized into four parts The first part principally covers theoretical developments and seismic data analysis techniques from the end of the nineteenth century until the present with the main emphasis on the development of instrumentation and its deployment The second part reviews the status of knowledge on the structure of the Earths shallow

layers starting with a global review of the Earth's crustal structure. The third part focuses on the Earth's deep structure divided into its main units: the upper mantle, the transition zone, and upper mantle discontinuities, the D region at the base of the mantle, and the Earth's core. The fourth part comprises two chapters which discuss constraints on Earth structure from fields other than seismology, mineral physics, and geodynamics. Self-contained volume starts with an overview of the subject, then explores each topic with in-depth detail. Extensive reference lists and cross references with other volumes to facilitate further research. Full color figures and tables support the text and aid in understanding. Content suited for both the expert and non-expert.

Paleo-Geodynamics Peculiarities of the Arctic Ocean Eurasian Floor Anatoly Schreider, Mikhail Klyuev, Alexandra Sazhneva, Andrey Brekhovskikh, 2024-03-19
 The book deals with some issues of paleo geodynamics of the Eurasian floor of the Arctic Ocean. A comprehensive geological and geophysical analysis of information on the anomalous magnetic field in the Eurasian Basin was carried out using modeling of the inversion magnetically active layer of the oceanic crust. As a result of this analysis, the identification and spatial position of linear paleo magnetic anomalies were refined, which made it possible to significantly update the geochronology of the bottom of the Eurasian Basin and identify a number of stages in its evolution. On this basis, the features and stages of the kinematics of the development of the bottom of the Eurasian Basin in the past were revealed. At the first Cretaceous-Paleogene stage prior to the formation of the A26 paleo anomaly on the Eurasian margin, extension processes developed significantly and turned into rifting. In the process of rifting, weakened zones and related fractures were formed along which the Siberian continental margin began to be torn off about 60 Ma ago with the formation of the Lomonosov Ridge. At the second stage of evolution, rifting turned into spreading, and the growth rate of the new oceanic crust in the A26-A24 paleo anomaly interval 59-53 Ma ago was more than 2.5 cm/yr. At the same time, the northern flank of the Mid Arctic Ridge grew more intensively than the southern one. The third stage was characterized by a further progressive slowdown in the process of bottom spreading, the minimum of which, with spreading rates of about 1 cm/year, fell on the formation of paleo anomalies A13-A6 30-20 million years ago. The fourth stage of growth of the new oceanic crust began later than the time of the A6 paleo anomaly and is characterized by some intensification of growth at rates up to 1.2 cm/yr. The average rate of bottom growth over an interval of almost 60 Ma turned out to be close to 1.3 cm/yr, which makes it possible to classify the Mid Arctic Ridge as a slow-growing one. On this basis, kinematic models of the development of bottom configurations were developed with the determination of the Euler poles, rotation angles, asymmetries, axes of spallation, and paleo bathymetry for the Eurasian Basin, the Polar part of the Lomonosov Ridge, the splitting of the Arlis Spura from the Lomonosov Ridge, the development of the Gakkel Ridge, and the development of the Greenland region of the bottom.
