Geographically Weighted Regression The Analysis Of Spatially Varying Relationships:

Geographically Weighted Regression A. Stewart Fotheringham, Chris Brunsdon, Martin Charlton, 2003-02-21

Geographical Weighted Regression GWR is a new local modelling technique for analysing spatial analysis This technique allows local as opposed to global models of relationships to be measured and mapped This is the first and only book on this technique offering comprehensive coverage on this new hot topic in spatial analysis Provides step by step examples of how to use the GWR model using data sets and examples on issues such as house price determinants educational attainment levels and school performance statistics Contains a broad discussion of and basic concepts on GWR through to ideas on statistical inference for GWR models uniquely features accompanying author written software that allows users to undertake sophisticated and complex forms of GWR within a user friendly Windows based front end see book for details

Geographically Weighted Regression A. Stewart Fotheringham, 2002 Geographically Weighted Regression The Analysis of Spatially Varying Relationships is based on the premise that relationships between variables measured at different locations might not be constant over space The prevailing assumption is that such relationships are constant an assumption that would appear to be the result of convenience rather than of any serious examination of the issues If relationships do vary significantly over space then serious questions are raised about the reliability of traditional global level analyses Geographically Weighted Regression as part of a broader research area in local modelling provides a new analytical tool and a different perspective on spatial analysis Instead of being restricted to simple global analyses in which interesting local variations in relationships are averaged away and unobservable GWR allows local relationships to be measured and mapped In many ways the output from GWR is similar to that presented by a microscope previously unimagined detail suddenly comes into focus This book challenges many of the global statements of spatial relationships that have been made in the academic literature Geographically Weighted Regression The Analysis of Spatially Varying Relationships contains a broad discussion of local models in general and of the details of GWR and provides many empirical examples on issues such as house price determinants educational attainment levels and school performance statistics A unique accompanying feature of this book is the author written software that allows users to undertake sophisticated and complex forms of GWR within a user friendly Windows based front end This software is readily available from the authors and notes on using the software and an example application are documented in the book itself Geographically Weighted Regression The Analysis of Spatially Varying Relationships is an essential resource for quantitative spatial analysts and GIS researchers and students It will be of interest to researchers in any discipline in which spatial data are used across the broad spectrum of social sciences medicine science and engineering The underlying message is that locality is important and measuring local relationships is vital to understanding spatial processes Stewart Fotheringham and his colleagues have produced a book that will be widely used by geographers and others interested in spatial analysis Geographically weighted regression is an important method and the

authors have developed and explained it well Peter Rogerson Department of Geography University at Buffalo USA The realisation that almost any statistic can be made local and that mapping the results almost always leads to greater insight is powering a revolution in spatial analysis In particular the localisation of standard regression models or GWR has led to important and powerful insights This book written by the team that has done most to develop it makes this approach accessible for the first time under a single cover It should be required reading for anyone involved with the analysis of spatially referenced data David Unwin School of Geography Birkbeck College London Publisher description

Multiscale Geographically Weighted Regression A. Stewart Fotheringham, Taylor M. Oshan, Ziqi Li, 2023-11-15 Multiscale geographically weighted regression MGWR is an important method that is used across many disciplines for exploring spatial heterogeneity and modeling local spatial processes This book introduces the concepts behind local spatial modeling and explains how to model heterogeneous spatial processes within a regression framework It starts with the basic ideas and fundamentals of local spatial modeling followed by a detailed discussion of scale issues and statistical inference related to MGWR A comprehensive guide to free user friendly software for MGWR is provided as well as an example of the application of MGWR to understand voting behavior in the 2020 US Presidential election Multiscale Geographically Weighted Regression Theory and Practice is the definitive guide to local regression modeling and the analysis of spatially varying processes a very cutting edge hands on and innovative resource Features Provides a balance between conceptual and technical introduction to local models Explains state of the art spatial analysis technique for multiscale regression modeling Describes best practices and provides a detailed walkthrough of freely available software through examples and comparisons with other common spatial data modeling techniques Includes a detailed case study to demonstrate methods and software Takes a new and exciting angle on local spatial modeling using

MGWR an innovation to the previous local modeling bible GWR The book is ideal for senior undergraduate and graduate students in advanced spatial analysis and GIS courses taught in any spatial science discipline as well as for researchers academics and professionals who want to understand how location can affect human behavior through local regression modeling

Spatial Data Analysis With R Danlin Yu, 2025-02-27 This is an introduction for social science students to the growing field of spatial data analysis using the R platform The text assumes no prior knowledge of either beyond the contents of an introductory statistics course It uses the open source software R and relevant spatial data analysis packages to provide practical guidance of how to conduct spatial data analysis with readers own data sets The book first briefly introduces students to R covers some basic concepts in statistical data analysis and then focuses on discussing the central ideas of spatial data analysis All the discussions are supported with R scripts so that students can work on their own and produce results that the book helps interpret Each chapter ends with review questions to test understanding The book is suited for upper level undergraduate social science students and graduate students and other social scientists who are interested in analyzing their spatial data with R A companion website for the book at <https://edge.sagepub.com/you> includes R code and data for students to replicate the examples in the book The password protected instructor side of the site includes exercises and answers which can be set for homework

Encyclopedia of Geographic Information Science Karen Kemp, 2008 Geographic information science GIScience is an emerging field that combines aspects of many different disciplines Spatial literacy is rapidly becoming recognized as a new essential pier of basic education alongside grammatical logical and mathematical literacy By incorporating location as an essential but often overlooked characteristic of what we seek to understand in the natural and built environment geographic information science GIScience and systems GISystems provide the conceptual foundation and tools to explore this new frontier The Encyclopedia of Geographic Information Science covers the essence of this exciting new and expanding field in an easily understood but richly detailed style In addition to contributions from some of the best recognized scholars in GIScience this volume contains contributions from experts in GIS supporting disciplines who explore how their disciplinary perspectives are expanded within the context of GIScience what changes when consideration of location is added what complexities in analytical procedures are added when we consider objects in 2 3 or even 4 dimensions what can we gain by visualizing our analytical results on a map or 3D display Key Features Brings together GIScience literature that is spread widely across the academic spectrum Offers details about the key foundations of GIScience no matter what their disciplinary origins Elucidates vocabulary that is an amalgam of all of these fields Key Themes Conceptual Foundations Cartography and Visualization Design Aspects Data Manipulation Data Modeling Geocomputation Geospatial Data Societal Issues Spatial Analysis Organizational and Institutional Aspects The Encyclopedia of Geographic Information Science is an important resource for academic and corporate libraries

Advanced Introduction to Spatial Statistics Griffith, Daniel A., Li, Bin, 2022-08-12 This Advanced Introduction provides a critical review and

discussion of research concerning spatial statistics differentiating between it and spatial econometrics to answer a set of core questions covering the geographic tagging of data origins of the concept and its theoretical underpinnings conceptual advances and challenges for future scholarly work It offers a vital tool for understanding spatial statistics and surveys how concerns about violating the independent observations assumption of statistical analysis developed into this discipline

Spatial Econometric Methods in Agricultural Economics Using R Paolo Postiglione, 2021-12-23 Modern tools such as GIS and remote sensing are increasingly used in the monitoring of agricultural resources The developments in GIS technology offer growing opportunities to agricultural economics analysts dealing with large and detailed spatial databases allowing them to combine spatial information from different sources and to produce different models The availability of these valuable sources of information makes the advanced models suggested in the spatial statistic and econometric literature applicable to agricultural economics This book aims at supporting stakeholders to design spatial surveys for agricultural data and or to analyse the geographically collected data This book attempts to describe the main typology of agricultural data and the most appropriate methods for the analysis together with a detailed description of the available data sources and their collection methods Topics such as spatial interpolation point patterns spatial autocorrelation survey data analysis small area estimation regional data modelling and spatial econometrics techniques are covered jointly with issues arising from the integration of several data types The theory of spatial methods is complemented by real and or simulated examples implemented through the open source software R
