Lake, British Geological Survey, 1986 **The Early Middle Pleistocene in Europe** Charles Turner, 2020-08-26 These papers show how new research in the classic areas and Germany but particularly in Eastern Europe is radically altering views of the stratigraphy and palaeocology of the early middle Pleistocene period showing that major glaciations did not begin only in the late middle Pleistocene **A revised correlation of Tertiary rocks in the British Isles and adjacent areas of NW Europe** C. Lyons, Arthur H. Brownlow, 1976-01-01 **Quaternary of the Thames** D.R. Bridgland, 2012-12-06 The principal aim of this volume is to provide descriptions of Sites of Special Scientific Interest selected as part of the Geological Conservation Review that yield evidence for the Pleistocene history of the River Thames and its tributaries Although defined thematically the volume covers all Pleistocene GCR sites in the Thames valley A number of sites in southern East Anglia are also included because they provide important evidence bearing on the history of the

Thames system The justification for a GCR volume devoted to the Thames lies in the special importance of the river in the British Quaternary The volume is concerned with the history of Britain over approximately the last two million years of geological time during the repeated glacial phases of the Quaternary Ice Age and the warmer intervals between them Many such climatic fluctuations are recorded in the deposits of the Thames which can be shown to have existed as the predominant west to east drainage line in south eastern England throughout the Pleistocene The Thames has left a detailed record of its earlier presence in the form of deposits which comprise fluviially aggraded floodplain sediments predominantly gravels preserved on the valley sides where they form geomorphological terrace features The oldest deposits are at the highest levels forming a terrace staircase that records successive stages in the evolution of the valley
