Geometric Galois Actions: Volume 2, The Inverse Galois Problem, Moduli Spaces and Mapping Class Groups Leila Schneps, Pierre Lochak, 1997-08-07 This book surveys progress in the domains described in the hitherto unpublished manuscript *Esquisse d'un Programme* Sketch of a Program by Alexander Grothendieck It will be of wide interest amongst workers in algebraic geometry number theory algebra and topology

Rigidity and Symmetry Robert Connelly, Asia Ivić Weiss, Walter Whiteley, 2014-06-11 This book contains recent contributions to the fields of rigidity and symmetry with two primary focuses to present the mathematically rigorous treatment of rigidity of structures and to explore the interaction of geometry algebra and combinatorics Contributions present recent trends and advances in discrete geometry particularly in the theory of polytopes The rapid development of abstract polytope theory has resulted in a rich theory featuring an attractive interplay of methods and tools from discrete geometry group theory classical geometry hyperbolic geometry and topology Overall the book shows how researchers from diverse backgrounds explore connections among the various discrete structures with symmetry as the unifying theme The volume will be a valuable source as an introduction to the ideas of both combinatorial and geometric rigidity theory and its applications incorporating the surprising impact of symmetry It will appeal to students at both the advanced undergraduate and graduate levels as well as post docs structural engineers and chemists

Homotopy of Operads and Grothendieck-Teichmüller Groups Benoit Fresse, 2017-04-21 The Grothendieck Teichmüller group was defined by Drinfeld in quantum group theory with insights coming from the Grothendieck program in Galois theory The ultimate goal of this book is to explain that this group has a topological interpretation as a group of homotopy automorphisms associated to the operad of little 2 discs which is an object used to model commutative homotopy structures in topology This volume gives a comprehensive survey on the algebraic aspects of this subject The book explains the definition of an operad in a general context reviews the definition of the little discs operads and explains the definition of the Grothendieck Teichmüller group from the viewpoint of the theory of operads In the course of this study the relationship between the little discs operads and the definition of universal operations associated to braided monoidal category structures is explained Also provided is a

comprehensive and self contained survey of the applications of Hopf algebras to the definition of a rationalization process the Malcev completion for groups and groupoids Most definitions are carefully reviewed in the book it requires minimal prerequisites to be accessible to a broad readership of graduate students and researchers interested in the applications of operads

Primes and Knots Toshitake Kohno, 2006 This volume deals systematically with connections between algebraic number theory and low dimensional topology Of particular note are various inspiring interactions between number theory and low dimensional topology discussed in most papers in this volume For example quite interesting are the use of arithmetic methods in knot theory and the use of topological methods in Galois theory Also expository papers in both number theory and topology included in the volume can help a wide group of readers to understand both fields as well as the interesting analogies and relations that bring them together

Valuation Theory and Its Applications Franz-Viktor Kuhlmann, Salma Kuhlmann, Murray Marshall, 2002-01-01 This book is the first of two proceedings volumes stemming from the International Conference and Workshop on Valuation Theory held at the University of Saskatchewan Saskatoon SK Canada Valuation theory arose in the early part of the twentieth century in connection with number theory and has many important applications to geometry and analysis the classical application to the study of algebraic curves and to Dedekind and Prufer domains the close connection to the famous resolution of the singularities problem the study of the absolute Galois group of a field the connection between ordering valuations and quadratic forms over a formally real field the application to real algebraic geometry the study of noncommutative rings etc The special feature of this book is its focus on current applications of valuation theory to this broad range of topics Also included is a paper on the history of valuation theory The book is suitable for graduate students and research mathematicians working in algebra algebraic geometry number theory and mathematical logic

Valuations, Orderings, and Milnor K -Theory Ido Efrat, 2006 This monograph is a comprehensive exposition of the modern theory of valued and ordered fields It presents the classical aspects of such fields their arithmetic topology and Galois theory Deeper cohomological aspects are studied in its last part in an elementary manner This is done by means of the newly developed theory of generalized Milnor K rings The book emphasizes the close connections and interplay between valuations and orderings and to a large extent studies them in a unified manner The presentation is almost entirely self contained In particular the text develops the needed machinery of ordered abelian groups This is then used throughout the text to replace the more classical techniques of commutative algebra Likewise the book provides an introduction to the Milnor K theory The reader is introduced to the valuation theoretic techniques as used in modern Galois theory especially in applications to birational anabelian geometry where one needs to detect valuations from their cohomological footprints These powerful techniques are presented here for the first time in a unified and elementary way

Arithmetic Fundamental Groups and Noncommutative Algebra Michael D. Fried, Yasutaka Ihara, 2002 The arithmetic and geometry of moduli spaces and their fundamental groups are a very active research area This book offers a complete overview of developments made

over the last decade The papers in this volume examine the geometry of moduli spaces of curves with a function on them The main players in Part 1 are the absolute Galois group $G_{\mathbb{Q}}$ of the algebraic numbers and its close relatives By analyzing how $G_{\mathbb{Q}}$ acts on fundamental groups defined by Hurwitz moduli problems the authors achieve a grand generalization of Serre's program from the 1960s Papers in Part 2 apply theta functions and configuration spaces to the study of fundamental groups over positive characteristic fields In this section several authors use Grothendieck's famous lifting results to give extensions to wildly ramified covers Properties of the fundamental groups have brought collaborations between geometers and group theorists Several Part 3 papers investigate new versions of the genus 0 problem In particular this includes results severely limiting possible monodromy groups of sphere covers Finally Part 4 papers treat Deligne's theory of Tannakian categories and arithmetic versions of the Kodaira Spencer map This volume is geared toward graduate students and research mathematicians interested in arithmetic algebraic geometry

Automorphisms of Riemann Surfaces, Subgroups of Mapping Class Groups and Related Topics Aaron Wootton, S. Allen Broughton, Jennifer Paulhus, 2022-02-03

Automorphism groups of Riemann surfaces have been widely studied for almost 150 years This area has persisted in part because it has close ties to many other topics of interest such as number theory graph theory mapping class groups and geometric and computational group theory In recent years there has been a major revival in this area due in part to great advances in computer algebra systems and progress in finite group theory This volume provides a concise but thorough introduction for newcomers to the area while at the same time highlighting new developments for established researchers The volume starts with two expository articles The first of these articles gives a historical perspective of the field with an emphasis on highly symmetric surfaces such as Hurwitz surfaces The second expository article focuses on the future of the field outlining some of the more popular topics in recent years and providing 78 open research problems across all topics The remaining articles showcase new developments in the area and have specifically been chosen to cover a variety of topics to illustrate the range of diversity within the field

Geometry of Algebraic Curves Enrico Arbarello, Maurizio Cornalba, Phillip Griffiths, 2011-03-10

The second volume of the Geometry of Algebraic Curves is devoted to the foundations of the theory of moduli of algebraic curves Its authors are research mathematicians who have actively participated in the development of the Geometry of Algebraic Curves The subject is an extremely fertile and active one both within the mathematical community and at the interface with the theoretical physics community The approach is unique in its blending of algebro-geometric complex analytic and topological combinatorial methods It treats important topics such as Teichmüller theory the cellular decomposition of moduli and its consequences and the Witten conjecture The careful and comprehensive presentation of the material is of value to students who wish to learn the subject and to experts as a reference source The first volume appeared 1985 as vol 267 of the same series
