

Congruence of Triangles

Congruence of Figures:

Two figures (usually shapes or objects) are considered congruent if they have the same shape and size. This means that one can be transformed into the other through translations, rotations, and reflections without changing its size or shape. It's like saying they are identical in every way, except for their position in space.

The relation of two objects being congruent is called congruence.

$$F_1 = F_2$$

All geometrical figures are combined to add a method used is called superposition method.

Congruence of Line Segments:

Line segments are parts of line. If two line segments have the same (ie., equal) length, they are congruent. Also if two line segments are congruent, they have the same length.

In view of the above fact, when two line segments are congruent, we sometimes just say the line segments are equal; and we also write $AB = CD$ (What we actually mean say $\overline{AB} \equiv \overline{CD}$).
