Geometry And Analysis In Dynamical Systems:

Geometry And Analysis In Dynamical Systems - Proceedings Of The Rims Conference H Ito, 1994-10-10 Fuzzy logic has found applications in an incredibly wide range of areas in the relatively short time since its conception It was invented by Lotfi Zadeh a leading systems expert so it is perhaps not surprising that system theory is one of the areas in which fuzzy logic has made a profound impact Fuzzy logic combined with the paradigm of computing with words allows the use and manipulation of human knowledge and reasoning in the modeling and control of dynamical systems This monograph presents new approaches to the construction of fuzzy models and to the design of fuzzy controllers The emphasis is on developing methods that allow systematic design on the one hand and mathematical analysis of the resulting system on the other In particular the methods described allow rigorous analysis of the stability and robustness of the systems which are crucial issues in control theory The first theme of the book is a new approach to the systematic design and analysis of fuzzy controllers given linguistic information concerning the plant and the control objective The new approach fuzzy Lyapunov synthesis is a computing with words version of the well known classical Lyapunov synthesis method The second theme of the book is to show that fuzzy controllers are in fact solutions of a nonlinear optimal control problem The authors formulate a novel nonlinear optimal control problem consisting of a new state space model referred to as the hyperbolic state space model and a new cost functional and show that its solution is a fuzzy controller This leads to a new framework for fuzzy modeling and control that combines the advantages of the fuzzy world such as linguistic interpretability and of classical optimal control theory such as guaranteed stability and robustness

Dynamical Scale Transform In Tropical Geometry Tsuyoshi Kato, 2016-10-21 This book provides comprehensive analysis of dynamical systems in tropical geometry which include the author's significant discoveries and pioneering contributions Tropical geometry is a kind of dynamical scale transform which connects real rational dynamics with piecewise linear one presented by max and plus algebras A comparison method is given which estimates orbits corresponding to different rational dynamics by reduction to the piecewise linear dynamics Both rational and piecewise linear dynamics appear in many important branches of mathematics Tropical geometry can play a role or function to bridge between different subjects in mathematics This book contains detailed accounts of basic strategy on how to apply tropical geometry to analysis in various mathematical subjects by presenting several applications which include a rough classification of partial differential equations from the point of view of global behavior of solutions construction of the infinite quasi recursive rational dynamics based on the automaton of the Burnside group by Aleshin Grigorchuk study on nearly periodicity of the pentagram map on the moduli space of the twisted polygons spectral coincidence between lamplighter group in theory of automata groups and Box and ball systems corresponding to KdV equation in soliton theory This book is self contained and detailed accounts of theory of automata groups BBS and the pentagram map are also included

Geometric Analysis and Nonlinear Partial Differential Equations Stefan Hildebrandt, Hermann Karcher, 2012-12-06. This book is not a textbook but rather a coherent collection of papers from the field of partial differential equations. Nevertheless, we believe that it may very well serve as a good introduction into some topics of this classical field of analysis which, despite of its long history, is highly modern and well prospering. Richard Courant wrote in 1950: "It has always been a temptation for mathematicians to present the crystallized product of their thought as a deductive general theory and to relegate the individual mathematical phenomenon into the role of an example. The reader who submits to the dogmatic form will be easily indoctrinated. Enlightenment, however, must come from an understanding of motives: live mathematical development springs from specific natural problems which can be easily understood but whose solutions are difficult and demand new methods or more general significance. We think that many, if not all, papers of this book are written in this spirit and will give the reader access to an important branch of analysis by exhibiting interesting problems worth to be studied. Most of the collected articles have an extensive introductory part describing the history of the presented problems as well as the state of the art and offer a well-chosen guide to the literature. This way the papers became lengthier than customary these days but the level of presentation is such that an advanced graduate student should find the various articles both readable and stimulating." **Geometric Analysis** Joaquín Pérez, José A. Galvez, 2012-07-16. This volume contains research and expository articles from the courses and talks given at the RSME Lluís A. Santaló Summer School Geometric Analysis held June 28-July 2 2010 in Granada, Spain. The goal of the Summer School was to present some of the many advances currently taking place in the interaction between partial differential equations and differential geometry, with special emphasis on the theory of minimal surfaces. This volume includes expository articles about the current state of specific problems involving curvature and partial differential equations with interactions to neighboring fields such as probability. An

introductory mostly self contained course on constant mean curvature surfaces in Lie groups equipped with a left invariant metric is provided The volume will be of interest to researchers post docs and advanced PhD students in the interface between partial differential equations and differential geometry *Geometric and Spectral Analysis* Pierre Albin,Dmitry Jakobson, Frédéric Rochon,2014-12-01 In 2012 the Centre de Recherches Math matiques was at the center of many interesting developments in geometric and spectral analysis with a thematic program on Geometric Analysis and Spectral Theory followed by a thematic year on Moduli Spaces Extremality and Global Invariants This volume contains original contributions as well as useful survey articles of recent developments by participants from three of the workshops organized during these programs Geometry of Eigenvalues and Eigenfunctions held from June 4 8 2012 Manifolds of Metrics and Probabilistic Methods in Geometry and Analysis held from July 2 6 2012 and Spectral Invariants on Non compact and Singular Spaces held from July 23 27 2012 The topics covered in this volume include Fourier integral operators eigenfunctions probability and analysis on singular spaces complex geometry K hler Einstein metrics analytic torsion and Strichartz estimates This book is co published with the Centre de Recherches Math matiques *Commutative Algebra and Algebraic Geometry* Freddy Van Oystaeyen,1999-03-31 Contains contributions by over 25 leading international mathematicians in the areas of commutative algebra and algebraic geometry The text presents developments and results based on and inspired by the work of Mario Fiorentini It covers topics ranging from almost numerical invariants of algebraic curves to deformation of projective schemes
