Geometry Of Characteristic Classes:

Geometry of Characteristic Classes Shigeyuki Morita, 2001 Characteristic classes are central to the modern study of the topology and geometry of manifolds They were first introduced in topology where for instance they could be used to define obstructions to the existence of certain fiber bundles Characteristic classes were later defined via the Chern Weil theory using connections on vector bundles thus revealing their geometric side In the late 1960s new theories arose that described still finer structures Examples of the so called secondary characteristic classes came from Chern Simons invariants Gelfand Fuks cohomology and the characteristic classes of flat bundles The new techniques are particularly useful for the study of fiber bundles whose structure groups are not finite dimensional The theory of characteristic classes of surface bundles is perhaps the most developed Here the special geometry of surfaces allows one to connect this theory to the theory of moduli space of Riemann surfaces i e Teichmüller theory In this book Morita presents an introduction to the modern theories of characteristic classes

Geometry of Characteristic Classes Shigeyuki Morita, 2001 Characteristic classes are central to the modern study of the topology and geometry of manifolds They were first introduced in topology where for instance they could be used to define obstructions to the existence of certain fiber bundles Characteristic classes were later defined using connections on vector bundles thus revealing their geometric side The purpose of this book is to introduce the reader to the three theories of characteristic classes that were developed in the late 1960s They include characteristic classes of flat bundles characteristic classes of foliations and charac

Complex Manifolds without Potential Theory Shiing-shen Chern, 2013-06-29 From the reviews of the second edition The new methods of complex manifold theory are very useful tools for investigations in algebraic geometry complex function theory differential operators and so on The differential geometrical methods of this theory were developed essentially under the influence of Professor S S Chern's works The present book is a second edition It can serve as an introduction to and a survey of this theory and is based on the author's lectures held at the University of California and at a summer seminar of the Canadian Mathematical Congress The text is illustrated by many examples The book is warmly recommended to everyone interested in complex differential geometry Acta Scientiarum Mathematicarum 41 3 4

Differential Geometry Loring W. Tu, 2017-06-01 This text presents a graduate level introduction to differential geometry for mathematics and physics students The exposition follows the historical development of the concepts of connection and curvature with the goal of explaining the Chern Weil theory of characteristic classes on a principal bundle Along the way we encounter some of the high points in the history of differential geometry for example Gauss Theorema Egregium and the Gauss Bonnet theorem Exercises throughout the book test the reader's understanding of the material and sometimes illustrate extensions of the theory Initially the prerequisites for the reader include a passing familiarity with manifolds After the first chapter it becomes necessary to understand and manipulate differential forms A knowledge of de Rham cohomology is required for the last third of the text Prerequisite material is

contained in author's text *An Introduction to Manifolds* and can be learned in one semester For the benefit of the reader and to establish common notations Appendix A recalls the basics of manifold theory Additionally in an attempt to make the exposition more self contained sections on algebraic constructions such as the tensor product and the exterior power are included Differential geometry as its name implies is the study of geometry using differential calculus It dates back to Newton and Leibniz in the seventeenth century but it was not until the nineteenth century with the work of Gauss on surfaces and Riemann on the curvature tensor that differential geometry flourished and its modern foundation was laid Over the past one hundred years differential geometry has proven indispensable to an understanding of the physical world in Einstein's general theory of relativity in the theory of gravitation in gauge theory and now in string theory Differential geometry is also useful in topology several complex variables algebraic geometry complex manifolds and dynamical systems among other fields The field has even found applications to group theory as in Gromov's work and to probability theory as in Diaconis's work It is not too far fetched to argue that differential geometry should be in every mathematician's arsenal

Geometry of Characteristic Classes Shiing-Shen Chern, 1977 **Characteristic Classes** John Willard Milnor, James D. Stasheff, 1974 The theory of characteristic classes provides a meeting ground for the various disciplines of differential topology differential and algebraic geometry cohomology and fiber bundle theory As such it is a fundamental and an essential tool in the study of differentiable manifolds In this volume the authors provide a thorough introduction to characteristic classes with detailed studies of Stiefel Whitney classes Chern classes Pontrjagin classes and the Euler class Three appendices cover the basics of cohomology theory and the differential forms approach to characteristic classes and provide an account of Bernoulli numbers Based on lecture notes of John Milnor which first appeared at Princeton University in 1957 and have been widely studied by graduate students of topology ever since this published version has been completely revised and corrected

Loop Spaces, Characteristic Classes and Geometric Quantization Jean-Luc Brylinski, 2007-11-15 This book examines the differential geometry of manifolds loop spaces line bundles and groupoids and the relations of this geometry to mathematical physics Applications presented in the book involve anomaly line bundles on loop spaces and anomaly functionals central extensions of loop groups Kähler geometry of the space of knots and Cheeger Chern Simons secondary characteristics classes It also covers the Dirac monopole and Dirac's quantization of the electrical charge **Characteristic Classes** John Willard Milnor, 1962 Symplectic Geometry and Secondary Characteristic Classes Izu Vaisman, 2014-01-15 The present work grew out of a study of the Maslov class $e g 37$ which is a fundamental invariant in asymptotic analysis of partial differential equations of quantum physics One of the many interpretations of this class was given by F Kamber and Ph Tondeur 43 and it indicates that the Maslov class is a secondary characteristic class of a complex trivial vector bundle endowed with a real reduction of its structure group In the basic paper of V I Arnold about the Maslov class 2 it is also pointed out without details that the Maslov class is characteristic in the category of vector bundles mentioned previously

Accordingly we wanted to study the whole range of secondary characteristic classes involved in this interpretation and we gave a short description of the results in 83 It turned out that a complete exposition of this theory was rather lengthy and moreover I felt that many potential readers would have to use a lot of scattered references in order to find the necessary information from either symplectic geometry or the theory of the secondary characteristic classes On the otherhand both these subjects are of a much larger interest in differential geometry and topology and in the applications to physical theories

Differential Geometry Elisabetta Barletta, Sorin Dragomir, Mohammad Hasan Shahid, Falleh R. Al-Solamy, 2025-02-06 This book Differential Geometry Manifolds Bundles and Characteristic Classes Book I A is the first in a captivating series of four books presenting a choice of topics among fundamental and more advanced in differential geometry DG such as manifolds and tensor calculus differentiable actions and principal bundles parallel displacement and exponential mappings holonomy complex line bundles and characteristic classes The inclusion of an appendix on a few elements of algebraic topology provides a didactical guide towards the more advanced Algebraic Topology literature The subsequent three books of the series are Differential Geometry Riemannian Geometry and Isometric Immersions Book I B Differential Geometry Foundations of Cauchy Riemann and Pseudohermitian Geometry Book I C Differential Geometry Advanced Topics in Cauchy Riemann and Pseudohermitian Geometry Book I D The four books belong to an ampler book project Differential Geometry Partial Differential Equations and Mathematical Physics by the same authors and aim to demonstrate how certain portions of DG and the theory of partial differential equations apply to general relativity and quantum gravity theory These books supply some of the ad hoc DG machinery yet do not constitute a comprehensive treatise on DG but rather Authors choice based on their scientific mathematical and physical interests These are centered around the theory of immersions isometric holomorphic and Cauchy Riemann CR and pseudohermitian geometry as devised by Sidney Martin Webster for the study of nondegenerate CR structures themselves a DG manifestation of the tangential CR equations

Scissors Congruences, Group Homology and Characteristic Classes Johan L. Dupont, 2001 These lecture notes are based on a series of lectures given at the Nankai Institute of Mathematics in the fall of 1998 They provide an overview of the work of the author and the late Chih Han Sah on various aspects of Hilbert's Third Problem Are two Euclidean polyhedra with the same volume scissors congruent i.e. can they be subdivided into finitely many pairwise congruent pieces The book starts from the classical solution of this problem by M. Dehn But generalization to higher dimensions and other geometries quickly leads to a great variety of mathematical topics such as homology of groups algebraic K theory characteristic classes for flat bundles and invariants for hyperbolic manifolds Some of the material particularly in the chapters on projective configurations is published here for the first time

Differential Geometry Clifford Henry Taubes, 2011-10-14 Bundles connections metrics and curvature are the lingua franca of modern differential geometry and theoretical physics This book will supply a graduate student in mathematics or theoretical physics with the fundamentals of these objects Many of the tools used in differential topology are introduced and the basic results about differentiable manifolds smooth maps differential forms vector fields Lie groups and Grassmannians

are all presented here Other material covered includes the basic theorems about geodesics and Jacobi fields the classification theorem for flat connections the definition of characteristic classes and also an introduction to complex and Kähler geometry Differential Geometry uses many of the classical examples from and applications of the subjects it covers in particular those where closed form expressions are available to bring abstract ideas to life Helpfully proofs are offered for almost all assertions throughout All of the introductory material is presented in full and this is the only such source with the classical examples presented in detail
