From Surfaces to Objects R. B. Fisher, 1989-06-07 A unified approach to the theory and practice of computer vision Presents a model based 3 dimensional scene analysis that combines surface patches segmented from the 3 dimensional scene description surface patch based object models a hierarchy of representations models and recognitions a distributed network based model invocation process and a knowledge based model matcher Describes the model independent scene analysis and how objects are represented and selected and shows how to locate verify and understand a known object given its geometric model

Describing and Recognizing 3-D Objects Using Surface Properties Ting-Jun Fan, 2012-12-06 Surface properties play a very important role in many perception tasks Object recognition navigation and inspection use surface properties extensively Characterizing surfaces at different scales in given data is often the first and possibly the most important step Most early research in machine perception relied on only very coarse characterization of surfaces In the last few years surface characterization has been receiving due attention Dr T J Fan is one of the very few researchers who designed and implemented a complete system for object recognition He studied issues related to characterization of surfaces in the context of object recognition and then uses the features thus developed for recognizing objects He uses a multi view representation of 3 D objects for recognition and he develops techniques for the segmentation of range images to obtain features for recognition His matching approach also allows him to recognize objects from their partial views in the presence of other occluding objects The efficacy of his approach is demonstrated in many examples

BMVC92 David Hogg, Roger Boyle, 2012-12-06 This book contains the 61 papers that were accepted for presentation at the 1992 British Machine Vision Conference Together they provide a snapshot of current machine vision research throughout the UK in 24 different institutions There are also several papers from vision groups in the rest of Europe North America and Australia At the start of the book is an invited paper from the first keynote speaker Robert Haralick The quality of papers submitted to the conference was very high and the programme committee had a hard task selecting around half for presentation at the meeting and inclusion in these proceedings It is a positive feature of the annual BMV A conference that the entire process from the submission deadline through to the conference itself and publication of the proceedings is completed in under 5 months My thanks to members of the programme committee for their essential contribution to the success of the conference and to Roger Boyle Charlie Brown Nick Efford and Sue Nemes for their

Readings in Computer Vision Martin A. Fischler, Oscar Firschein, 2014-06-28 The field of computer vision combines techniques from physics mathematics psychology artificial intelligence and computer science to examine how machines might construct meaningful descriptions of their surrounding environment The editors of this volume prominent researchers and leaders of the SRI International AI Center Perception Group have selected sixty papers most published since 1980 with the viewpoint that computer vision is concerned with solving seven basic problems Reconstructing 3D scenes from 2D images Decomposing images into their component parts Recognizing and assigning labels to scene objects Deducing and describing relations among scene objects Determining the nature of computer architectures that can support the visual function Representing abstractions in the world of computer memory Matching stored descriptions to image representation Each chapter of this volume addresses one of these problems through an introductory discussion which identifies major ideas and summarizes approaches and through reprints of key research papers Two appendices on crucial assumptions in image interpretation and on parallel architectures for vision applications a glossary of technical terms and a comprehensive bibliography and index complete the volume

Machine Vision for Three-Dimensional Scenes Herbert Freeman, 2012-12-02 Machine Vision for Three Dimensional Scenes contains the proceedings of the workshop Machine Vision Acquiring and Interpreting the 3D Scene sponsored by the Center for Computer Aids for Industrial Productivity CAIP at Rutgers University and held in April 1989 in New Brunswick New Jersey The papers explore the applications of machine vision in image acquisition and 3D scene interpretation and cover topics such as segmentation of multi sensor images the placement of sensors to minimize occlusion and the use of light striping to obtain range data Comprised of 14 chapters this book opens

with a discussion on 3D object recognition and the problems that arise when dealing with large object databases along with solutions to these problems The reader is then introduced to the free form surface matching problem and object recognition by constrained search The following chapters address the problem of machine vision inspection paying particular attention to the use of eye tracking to train a vision system images of 3D scenes and the attendant problems of image understanding the problem of object motion and real time range mapping The final chapter assesses the relationship between the developing machine vision technology and the marketplace This monograph will be of interest to practitioners in the fields of computer science and applied mathematics

Three-Dimensional Computer Vision Yoshiaki Shirai, 2012-12-06 The purpose of computer vision is to make computers capable of understanding environments from visual information Computer vision has been an interesting theme in the field of artificial intelligence It involves a variety of intelligent information processing both pattern processing for extraction of meaningful symbols from visual information and symbol processing for determining what the symbols represent The term 3D computer vision is used if visual information has to be interpreted as three dimensional scenes 3D computer vision is more challenging because objects are seen from limited directions and some objects are occluded by others In 1980 the author wrote a book Computer Vision in Japanese to introduce an interesting new approach to visual information processing developed so far Since then computer vision has made remarkable progress various rangefinders have become available new methods have been developed to obtain 3D information knowledge representation frameworks have been proposed geometric models which were developed in CAD CAM have been used for computer vision and so on The progress in computer vision technology has made it possible to understand more complex 3D scenes There is an increasing demand for 3D computer vision In factories for example automatic assembly and inspection can be realized with fewer constraints than conventional ones which employ two dimensional computer vision

Bhandarkar,2012-12-06 Computer Science Workbench is a monograph series which will provide you with an in depth working knowledge of current developments in computer technology Every volume in this series will deal with a topic of importance in computer science and elaborate on how you yourself can build systems related to the main theme You will be able to develop a variety of systems including computer software tools computer graphics computer animation database management systems and computer aided design and manufacturing systems Computer Science Workbench represents an important new contribution in the field of practical computer technology T08iyasu L Kunii PREFACE The primary aim of this book is to present a coherent and self contained description of recent advances in three dimensional object recognition from range images Three dimensional object recognition concerns recognition and localization of objects of interest in a scene from input images This problem is one of both theoretical and practical importance On the theoretical side it is an ideal vehicle for the study of the general area of computer vision since it deals with several important issues encountered in computer vision for example issues such as

feature extraction acquisition representation and proper use of knowledge employment of efficient control strategies coupling numerical and symbolic computations and parallel implementation of algorithms On the practical side it has a wide range of applications in areas such as robot vision autonomous navigation automated inspection of industrial parts and automated assembly

Analysis and Interpretation of Range Images Ramesh C. Jain, Anil K. Jain, 2012-12-06 Computer vision researchers have been frustrated in their attempts to automatically derive depth information from conventional two dimensional intensity images Research on shape from texture shape from shading and shape from focus is still in a laboratory stage and had not seen much use in commercial machine vision systems A range image or a depth map contains explicit information about the distance from the sensor to the object surfaces within the field of view in the scene Information about surface geometry which is important for say three dimensional object recognition is more easily extracted from 2 1 2 D range images than from 2D intensity images As a result both active sensors such as laser range finders and passive techniques such as multi camera stereo vision are being increasingly utilized by vision researchers to solve a variety of problems This book contains chapters written by distinguished computer vision researchers covering the following areas Overview of 3D Vision Range Sensing Geometric Processing Object Recognition Navigation Inspection Multisensor Fusion A workshop report written by the editors also appears in the book It summarizes the state of the art and proposes future research directions in range image sensing processing interpretation and applications The book also contains an extensive up to date bibliography on the above topics This book provides a unique perspective on the problem of three dimensional sensing and processing it is the only comprehensive collection of papers devoted to range images Both academic researchers interested in research issues in 3D vision and industrial engineers in search of solutions to particular problems will find this a useful reference book
