Genetic Improvement Of Vegetable Crops:

Genetic Improvement of Vegetable Crops G. Kalloo, B.O. Bergh, 2012-12-02 Genetic improvement has played a vital role in enhancing the yield potential of vegetable crops. There are numerous vegetable crops grown worldwide and variable degrees of research on genetics, breeding, and biotechnology have been conducted on these crops. This book brings together the results of such research on crops grouped as alliums, crucifers, cucurbits, leaf crops, tropical underground, and miscellaneous. Written by eminent specialists, each chapter concentrates on one crop and covers cytology, genetics, breeding objectives, germplasm resources, reproductive biology, selection, breeding methods, heterosis, and hybrid seed production, quality, and processing attributes and technology. This unique collection will be of great value to students, scientists, and vegetable breeders as it provides a reference guide on the genetics, breeding, and biotechnology of a wide range of vegetable crops.

Vegetable Crops Pritam Kalia, 2025-04-24 The volume on Vegetable Crops as a part of series entitled Handbooks of Crop Diversity Conservation and Use of Genetic Resources will be a unique resource, first of its kind, which will elaborate on origin, evolution, taxonomy, identification, chemical characterization, and genetic improvement of Vegetable Crop Plants. Vegetable crops are an important group of crops comprising solanaceous vegetables, Cole crops, Cucurbitaceous crops, Bulb crops, Root crops, Tuber crops, legume vegetables, leafy salad vegetables, Okra, etc. There is tremendous diversity within each group of vegetable crops. This genetic diversity is from the point of view of landraces and varieties of vegetable crops species used for food processing, nutraceuticals, pharmaceuticals, etc. Vegetables, being an integral part of human diet, being rich source of diverse nutrients such as vitamins, minerals, and antioxidants, they play an important role in balancing the diet and tackling malnutrition. Besides, due to their intensive cultivation, they also play an important role in enhancing per unit area production and productivity, cropping intensity, enhancing thereby the farmers' income, especially that of small and marginal farmers, and providing job opportunities. The genetic improvement of vegetable crops facilitates continued breeding of varieties with greater resilience to stresses and productivity is mainly dependent on overall genetic variation found in individuals belonging to the cultivated species and/or ancestral species related to cultivated species of vegetable crops. Since genes of interest can be tapped from plant sources for their introduction through controlled breeding processes for genetic improvement and incorporating of desirable external and internal quality traits, therefore, accessibility to the information about these plant genetic resources is key to the success of the breeding efforts. Since there is a need of comprehensive information about the genetic resources, therefore, it is important to facilitate their conservation and long-term sustainable use in research and improvement. The comprehensive information on the availability of genetic diversity in each vegetable crop species in this volume would facilitate priority conservation in gene banks, research, and use in vegetable crop improvement. Realizing the importance of genetic variability in the improvement of vegetable crops from the point of view of biotic and abiotic stress resistance, enhanced micronutrient, climate change enhanced shelf life, nutraceuticals, bioactive

compounds especially national and international efforts further need to be stepped up for collection characterization evaluation and conservation of vegetable crops genetic resources to facilitate search for new genes research and their use in vegetable crops improvement During 21st century genomics and marker assisted tools have gained importance for hastening the crop improvement programmes by enhancing breeding efficiency Realizing that population in South Asia and Southeast Asia is facing acute problem of under and malnutrition the emphasis on dietary diversification with vegetables is therefore being stressed Besides to enhance farmers income much emphasis is being laid on development of varieties having diverse maturity growth habit resistance to diseases and insect pest to reduce the use pesticides enhanced nutrients and shelf life For these traits we have to look into landraces and wild relatives for the traits of interest Therefore it has been felt to bring out a vegetable volume with additional accessory and supplemental information analyses and specifically filtered information which can go a long way in promoting research search for new genes alleles revealing the opportunities available for exploitation of PGR in generation of cultivars to meet upcoming challenges of vegetable crop improvement and diversification and requirement of cultivars for processing nutraceutical and pharmaceutical industry which will promote contract farming This will also help identification of geographical and genetic diversity gaps for future search of new genes collections Plant Genetic Resources PGR serve as treasures of genes of interest for developing improved future vegetable varieties hybrids besides being key to scientific efforts of developing gene pyramided varieties they are important for mitigating various challenges posed by increasing population climate change and health conscious society looking for nutraceuticals The proposed vegetable volume on agro biodiversity conservation and use of plant genetic resources with information on available genetic diversity among various groups of vegetable crops and component cultivated species within a group of food and agriculture in all possible perspectives would be able to reflect the opportunity available for genetic engineering of vegetable crop species It will also go a long way in facilitating more predictive and productive genetic engineering programme to breed futuristic vegetable crops varieties hybrids
