Geographic Information Systems in Ecology Carol A Johnston, 1998-02-11 Geographical information systems are one of the most revolutionary and important tools that have become available to ecological researchers in recent years Many ecologists are unaware however of the full power of GIS techniques and are not using them to their full advantage By providing examples of ecological applications at scales ranging from organisms to landscapes this new book offers basic information on the variety of analyses available using GIS Also discussed is the full scope for linkage to related technologies like remote sensing and methods like spatially explicit modelling Researchers will find this an invaluable guide to applying and getting the most out of GIS techniques Presumes no previous GIS experience A practical guide to using GIS in ecological research Uses numerous and varied experimental examples and data

Spatial Uncertainty for Ecology, 2001-06-29 This is one of the first books to take an ecological perspective on uncertainty in spatial data It applies principles and techniques from geography and other disciplines to ecological research and thus delivers the tools of cartography cognition spatial statistics remote sensing and computer sciences by way of spatial data After describing the uses of such data in ecological research the authors discuss how to account for the effects of uncertainty in various methods of analysis

Millington, Stephen J. Walsh, Patrick E. Osborne, 2013-03-11 In recent years the conservation of tropical forests has received worldwide publicity whereas effective forest management particularly for timber extraction has attracted little attention and gained some notoriety The overall aim of the present paper was to examine how environmental micro variation in the Chiquibul Forest Reserve of Belize can influence species distribution and thereby inform management strategy The paper deals first with the background to forest management in Belize then considers the methodology used in the present study and finally assesses the preliminary results The specific objectives are 1 to assess the effects of changing scale on the variability of selected individual soil properties in forest plots within the same vegetation class and 2 to examine

the variation in soil properties and tree species distribution and to integrate environmental and ecological data over a range of scales BACKGROUND Whereas the global and regional distribution of tropical forests is broadly governed by climatic and altitudinal variation individual forest tracts need to consider a range of other locally important factors to explain species distribution and change With very high species diversity tropical forests present a major challenge in the attempt to unravel controlling factors in distribution and growth Swaine et al 1987 Research that attempts to explain diversity has looked at species distribution according to a range of factors with a general recognition that soil fertility plays a significant if ill defined role Swaine 1996 **Geographic Information Systems and Remote Sensing Applications for Ecosystem**
