Guiding you through the process of evaluating your thoughts

Skill 3: Examining the evidence for and against your thoughts

Our thoughts aren't facts, they're assumptions, feelings, beliefs, automatic thoughts and opinions, or best guesses about what is going on in our lives.

The problem is that these guesses aren't always accurate or useful.

Remember, the aim of evaluating thoughts as CBT is not to think happy thoughts but it is to think accurately. How can you turn your guesses (automatic thoughts) into more accurate interpretations?

Examining the evidence for and against your thoughts can help you evaluate whether your thoughts are based on facts and work for you, rather than against you.

Prior to the military conflicts in Iraq and Afghanistan wars and conflicts have been characterized by such injuries as infectious diseases and catastrophic gunshot wounds. However, the signature injuries sustained by United States military personnel in these most recent conflicts are blast wounds and the psychiatric consequences to combat, particularly posttraumatic stress disorder (PTSD), which affects an estimated 13 to 20 percent of U.S. service members who have fought in Iraq or Afghanistan since 2001. PTSD is triggered by a specific traumatic event including combat, which leads to symptoms such as persistent re-experiencing of the event, emotional numbing or avoidance of thoughts, feelings, conversations or places associated with the trauma, and hyperarousal such as exaggerated startle responses or difficulty concentrating. As the U.S. reduces its military involvement in the Middle East, the Departments of Defense (DoD) and Veterans Affairs (VA) anticipate that increasing numbers of returning veterans will need PTSD services. As a result, Congress asked the DoD in consultation with the VA to sponsor an IOM study to assess both departments' PTSD treatment programs and services. *Treatment for Posttraumatic Stress Disorder in Military and Veteran Populations: Initial Assessment* is the first of two mandated reports; it examines some of the available programs to prevent, diagnose, treat, and rehabilitate those who have PTSD and encourages further research that can help to improve PTSD care. *Part I: Assessing the Impact of September 11th, 2001, on Children, Youth, and Parents in the United States* Elizabeth T. Gershoff, J. Lawrence Aber, 2018-12-07

These two special issues of *Applied Developmental Science* include eight major studies of the impacts of the September 11th 2001 terrorist attacks on children, youth, and their parents. Issue 1 includes a report of the impact of September 11th on New York City youth in comparison with that of everyday violence, as well as three studies which demonstrate the impact of the attacks on the mental health and coping strategies of adolescents throughout the country despite being physically distant from the event. Issue 2 includes a study of separation anxiety in school-age children in New York City following the attacks, the results from two national surveys of parents' roles in helping children respond to or process the attacks, and a study of the impact of such a distant trauma on rural youth. Sharing, 1978 **Resource Directory** University of Wisconsin--Madison. College of Agricultural and Life Sciences, 1993 **Work Stress and Coping** Philip J. Dewe, Cary L. Cooper, 2017-05-01
