Intelligent Engineering Systems and Computational Cybernetics J.A. Tenreiro Machado, Béla Pátkai, Imre J. Rudas, 2008-12-18 Engineering practice often has to deal with complex systems of multiple variable and multiple parameter models almost always with strong non linear coupling The conventional analytical techniques based approaches for describing and predicting the behaviour of such systems in many cases are doomed to failure from the outset even in the phase of the construction of a more or less appropriate mathematical model These approaches normally are too categorical in the sense that in the name of modelling accuracy they try to describe all the structural details of the real physical system to be modelled This can significantly increase the intricacy of the model and may result in a enormous computational burden without achieving considerable improvement of the solution The best paradigm exemplifying this situation may be the classic perturbation theory the less significant the achievable correction the

more work has to be invested to obtain it. A further important component of machine intelligence is a kind of structural uniformity giving room and possibility to model arbitrary particular details a priori not specified and unknown. This idea is similar to the ready to wear industry which introduced products which can be slightly modified later on in contrast to tailor made creations aiming at maximum accuracy from the beginning. These subsequent corrections can be carried out by machines automatically. This learning ability is a key element of machine intelligence. The past decade confirmed that the view of typical components of the present soft computing as fuzzy logic, neural computing, evolutionary computation and probabilistic reasoning are of complementary nature and that the best results can be applied by their combined application. Today the two complementary branches of Machine Intelligence that is Artificial Intelligence and Computational Intelligence serve as the basis of Intelligent Engineering Systems. The huge number of scientific results published in Journal and conference proceedings worldwide substantiates this statement. The present book contains several articles taking different viewpoints in the field of intelligent systems.

Fuzzy Evolutionary Computation Witold Pedrycz, 2012-12-06. As of today Evolutionary Computing and Fuzzy Set Computing are two mature well developed and highly advanced technologies of information processing. Each of them has its own clearly defined research agenda, specific goals to be achieved and a well set algorithmic environment. Concisely speaking Evolutionary Computing (EC) is aimed at a coherent population oriented methodology of structural and parametric optimization of a diversity of systems. In addition to this broad spectrum of such optimization applications this paradigm offers an important ability to cope with realistic goals and design objectives reflected in the form of relevant fitness functions. The GA search which is often regarded as a dominant domain among other techniques of EC such as evolutionary strategies, genetic programming or evolutionary programming delivers a great deal of efficiency helping navigate through large search spaces. The main thrust of fuzzy sets is in representing and managing nonnumeric linguistic information. The key notion whose conceptual as well as algorithmic importance has started to increase in the recent years is that of information granularity. It somewhat concurs with the principle of incompatibility coined by L. A. Zadeh. Fuzzy sets form a vehicle helpful in expressing a granular character of information to be captured. Once quantified via fuzzy sets or fuzzy relations the domain knowledge could be used efficiently very often reducing a heavy computation burden when analyzing and optimizing complex

Fletcher, 2021-10-25 This book aims to discuss the technical and ethical challenges posed by the present technological framework and to highlight the fundamental role played by human centred design and human factors in the definition of robotic architectures for human

robot collaboration The book gives an updated overview of the most recent robotic technology conceived and designed to collaborate with human beings in industrial working scenarios The technological development of robotics over the last years and the fast evolution of AI machine learning and IoT have paved the way for applications that extend far beyond the typical use of robots performing repetitive tasks in exclusive spaces In this new technological paradigm that is expected to drive the robotics market in the coming years robots and workers will coexist in the same workplace sharing not only this lived space but also the roles and functions inherent to a process of production merging the benefits of automated and manual performing However having robots cooperating in real time with workers responding in a physical psychological and social adequate way requires a human centred design that not only calls for high safety standards regulating the quality of human robot interaction but also demands the robot's fine grained perception and awareness of the dynamics of its surrounding environment namely the behaviours of their human peers their expected actions responses fostering the necessary collaborative efforts towards the accomplishment of the tasks to be executed

How Smart Is Your City? Maria Isabel Aldinhas Ferreira, 2020-10-20 This book focuses on the potential benefits that the so called smart technologies have been bringing to the urban reality and to the management and governance of the city simultaneously highlighting the necessity for its responsible and ethically guided deployment respecting essential humanistic values The urban ecosystem has been in the last decades the locus to where the most advanced forms of technological innovation converge creating intelligent management platforms meant to produce models of energy water consumption mobility transportation waste management and efficient cities Due to the coincidence of the punctual overlap of its own genesis with the pandemics outbreak the present book came to embody both the initial dream and desire of an intelligent city place of innovation development and equity a dream present in most of the chapters and the fear not just of the pandemics per se but of the consequences that this may have for the

character of the intelligent city and for the nature of its relationship with its dwellers that like a mother it is supposed to nurture shelter and protect
