Closed Object Boundaries from Scattered Points Remco Veltkamp, 1994-11-30 This monograph is devoted to computational morphology particularly to the construction of a two dimensional or a three dimensional closed object boundary through a set of points in arbitrary position By applying techniques from computational geometry and CAGD new results are developed in four stages of the construction process a the gamma neighborhood graph for describing the structure of a set of points b an algorithm for constructing a polygonal or polyhedral boundary based on a c the flintstone scheme as a hierarchy for polygonal and polyhedral approximation and localization d and a Bezier triangle based scheme for the construction of a smooth piecewise cubic boundary

Computational Kinematics J. Angeles, Günter Hommel, Peter Kovács, 2013-06-29 The aim of this book is to provide an account of the state of the art in Computational Kinematics We understand here under this term that branch of kinematics research involving intensive computations not only of the numer

ical type but also of a symbolic nature Research in kinematics over the last decade has been remarkably oriented towards the computational aspects of kinematics problems In fact this work has been prompted by the need to answer fundamental questions such as the number of solutions whether real or complex that a given problem can admit Problems of this kind occur frequently in the analysis and synthesis of kinematic chains when finite displacements are considered The associated models that are derived from kinematic relations known as closure equations lead to systems of nonlinear algebraic equations in the variables or parameters sought What we mean by algebraic equations here is equations whereby the unknowns are numbers as opposed to differential equations where the unknowns are functions The algebraic equations at hand can take on the form of multivariate polynomials or may involve trigonometric functions of unknown angles Because of the nonlinear nature of the underlying kinematic models purely numerical methods turn out to be too restrictive for they involve iterative procedures whose convergence cannot in general be guaranteed Additionally when these methods converge they do so to only isolated solutions and the question as to the number of solutions to expect still remains
