Fast Light Slow Light And Left Handed Light:

Fast Light, Slow Light and Left-Handed Light P.W. Milonni, 2004-11-30 The propagation of light in dispersive media is a subject of fundamental as well as practical importance In recent years attention has focused in particular on how refractive index can vary with frequency in such a way that the group velocities of optical pulses can be much greater or much smaller than the speed of light in vacuum or in which the refractive index can be negative Treating these topics at an introductory to intermediate level **Fast Light Slow Light and Left Handed Light** focuses on the basic theory and describes the significant experimental progress made during the past decade The book pays considerable attention to the fact that superluminal group velocities are not in conflict with special relativity and to the role of quantum effects in preventing superluminal communication and violations of Einstein causality It also explores some of the basic physics at the opposite extreme of very slow group velocities as well as stopped and regenerated light including the concepts of electromagnetically induced transparency and dark state polaritons Another very active aspect of the subject discussed concerns the possibility of designing metamaterials in which the refractive index can be negative and propagating light is left handed in the sense that the phase and group velocities are in opposite directions The last two chapters are an introduction to some of the basic theory and consequences of negative refractive index with emphasis on the seminal work carried out since 2000 The possibility that perfect lenses can be made from negative index metamaterials which has been perhaps the most controversial aspect of the field is introduced and discussed in some detail

Evanescent Waves in Optics Mario Bertolotti, Concita Sibilia, Angela M. Guzman, 2017-10-30 This monograph provides an introductory discussion of evanescent waves and plasmons describes their properties and uses and shows how they are fundamental when operating with nanoscale optics Far field optics is not suitable for the design description and operation of devices at this nanometre scale Instead one must work with models based on near field optics and surface evanescent waves The new discipline of plasmonics has grown to encompass the generation and application of plasmons both as a travelling excitation in a nanostructure and as a stationary enhancement of the electrical field near metal nanosurfaces The book begins with a brief review of the basic concepts of electromagnetism then introduces evanescent waves through reflection and refraction and shows how they appear in diffraction problems before discussing the role that they play in optical waveguides and sensors The application of evanescent waves in super resolution devices is briefly presented before plasmons are introduced The surface plasmon polaritons SPPs are then treated highlighting their potential applications also in ultra compact circuitry The book concludes with a discussion of the quantization of evanescent waves and quantum information processing The book is intended for students and researchers who wish to enter the field or to have some insight into the matter It is not a textbook but simply an introduction to more complete and in depth discussions The field of plasmonics has exploded in the last ten years and most of the material treated in this book is scattered in original or review papers A short comprehensive treatment is missing this book is intended to

Matthew A. Morgan, 2024-06-30 This book explores the fundamental but often overlooked connection between Maxwell s equations as they are taught in undergraduate electrical engineering courses and special relativity Written for an audience of practical engineers instead of theoretical physicists it exposes the underlying contradictions brought about by the emergence of electromagnetic theory one of the greatest triumphs in mathematical physics of all time that unified the phenomena of electricity magnetism and light into a world in which the classical Galilean principle of relativity was considered incontrovertible It explains how Einstein redefined the concepts of space and time and what it means to measure them while altogether disbanding the notion of global simultaneity A manifestly relativistic formulation of electromagnetic laws is first presented and then applied to common engineering problems like the interaction of electromagnetic fields at dynamic interfaces the derivation of propagating modes in closed metal waveguides and the foundations of microwave network theory Mathematical toolkits for relativistic analysis such as tensor notation and spacetime algebra are explained These tools are then used to analyze the consequences of motion at relativistic speeds upon otherwise well known electromagnetic circuit

behaviors Well drawn and insightful diagrams along with articulate explanations help the reader to gain an intuitive understanding of four dimensional spacetime and the nature of the electromagnetic field in that context while summary tables and comprehensive appendices serve as a resource for further selfdirected exploration Readers trained in microwave engineering will learn to see their field from a new perspective and shall gain from that new insight the ability to conceive of unexpected solutions to practical engineering problems that might otherwise defy one s intuition **Progress in Optics**

Principles of Laser Spectroscopy and Quantum Optics Paul R. Berman, Vladimir S. Malinovsky, 2011-01-02 Principles of Laser Spectroscopy and Quantum Optics is an essential textbook for graduate students studying the interaction of optical fields with atoms. It also serves as an ideal reference text for researchers working in the fields of laser spectroscopy and quantum optics. The book provides a rigorous introduction to the prototypical problems of radiation fields interacting with two and three level atomic systems. It examines the interaction of radiation with both atomic vapors and condensed matter systems, the density matrix and the Bloch vector and applications involving linear absorption and saturation spectroscopy. Other topics include hole burning, dark states, slow light and coherent transient spectroscopy, as well as atom optics and atom interferometry. In the second half of the text, the authors consider applications in which the radiation field is quantized. Topics include spontaneous decay, optical pumping, sub-Doppler laser cooling, the Heisenberg equations of motion for atomic and field operators and light scattering by atoms in both weak and strong external fields. The concluding chapter offers methods for creating entangled and spin-squeezed states of matter. Instructors can create a one semester course based on this book by combining the introductory chapters with a selection of the more advanced material. A solutions manual is available to teachers. Rigorous introduction to the interaction of optical fields with atoms. Applications include linear and nonlinear spectroscopy, dark states and slow light. Extensive chapter on atom optics and atom interferometry. Conclusion explores entangled and spin-squeezed states of matter. Solutions manual available only to teachers.
