Refractory metals are a class of metals that are extraordinarily resistant to heat and wear making them more expensive to be obtained. Refractory metals are somehow rare compared to base metals. Refractory metals are particular as they can withstand very tough operating conditions. These qualities come from their particular properties rendering difficult their processing that we will describe in this book from heavy sands processing especially for titanium zirconium tungsten molybdenum vanadium and rhenium. Some of these metals can be found together and some of them are by products of other metallurgies like copper for molybdenum. They all share some properties including a melting point above 2000 °C and high hardness at room temperature. They are chemically inert and have a relatively high density. Their high melting points make powder metallurgy the method of choice for fabricating components from these metals. Some of their applications include tools to work metals at high temperatures, wire filaments, casting molds, and chemical reaction vessels in corrosive environments. Roger Rumbu, Met Eng PPM TBOM.

Comprehensive Hard Materials Daniele Mari, Luis Miguel, Christoph E. Nebel, 2014-02-01. Comprehensive Hard Materials Three Volume Set deals with the production, uses, and properties of the carbides, nitrides, and borides of these metals and those of titanium, as well as tools of ceramics, the superhard boron nitrides, and diamond, and related compounds. Articles include the technologies of powder production including their precursor materials, milling, granulation, cold and hot compaction, sintering, hot isostatic pressing, hot pressing, injection moulding, as well as on the coating technologies for refractory metals, hard metals, and hard materials. The characterization, testing, quality assurance, and applications are also covered. Comprehensive Hard Materials provides meaningful insights on materials at the leading edge of technology. It aids continued research and development of these materials and, as such, it is a critical information resource to academics and industry professionals facing the technological challenges of the future. Hard materials operate at the leading edge of technology and continued research and development of such materials is critical to meet the technological challenges of the future. Users of this work can improve their knowledge of basic principles and gain a better understanding of process-structure-property relationships. With the convergence of nanotechnology, coating techniques, and functionally graded materials to the cognitive science of cemented carbides, cermets, advanced ceramics, superhard materials, and composites, it is evident that the full potential of this class of materials is far from exhausted. This work unites these important areas of research and will provide useful insights to users through its extensive cross-referencing and thematic presentation. To link academic to industrial usage of hard materials and vice versa, this work deals with the production, uses, and properties of the carbides, nitrides, and borides of these metals and those of titanium, as well as tools of ceramics, the superhard boron nitrides, and diamond, and related compounds.      *Minerals Yearbook* United States.
