Manifestations of Hepatitis C Virus Infection Lucija Virović Jukić, 2017 Chronic hepatitis C virus HCV infection causes progressive liver fibrosis cirrhosis liver failure and hepatocellular carcinoma Additional to liver damage HCV infection causes a variety of systemic disorders some of which sometimes bear more severe morbidity than the liver disease itself These extrahepatic manifestations represent a wide spectrum of disorders ranging from the presence of a variety of clinically

insignificant autoantibodies to diseases affecting a variety of organ systems Mixed cryoglobulinemia is a common manifestation and associated vasculitis can affect many organs kidney skin and joints The skin can also be affected by porphyria cutanea tarda and lichen planus Other common extrahepatic manifestations include autoimmune disorders lymphoproliferative disorders and a number of neurological and neuropsychiatric disorders such as fatigue depression or cognitive impairment Insulin resistance diabetes mellitus accelerated atherosclerosis and increased cardiovascular disease morbidity and mortality have also been associated with chronic HCV infection The existence and severity of extrahepatic manifestations do not correlate with the severity of liver disease and the mainstay of treatment is HCV eradication Patients with systemic manifestations of HCV infection should be prioritized for treatment especially in the era of new interferon free therapies with fewer side effects
